The Foundation for The Gator Nation

Population Projections by Age, Sex, Race, and Hispanic Origin for Florida and Its Counties, 2009–2030

The composition of Florida's population has changed substantially in recent decades. Between 1950 and 2000, for example, the proportion of Florida's population younger than age 15 declined from 26.2 to 19.0 percent; the proportion age 65 and older rose from 8.6 to 17.6 percent; and the proportion black declined from 21.7 to 14.6 percent. The Hispanic population increased from 6.0 percent of the total population in 1970 to 16.8 percent in 2000. Changes in demographic composition have been even greater for many counties than for the state as a whole.

These changes have important implications for planning and public policy. They affect the demand for education, healthcare, housing, recreation, transportation, and many other goods and services. They affect the number and characteristics of persons in the labor force and in public and private retirement systems. They affect the allocation of many types of public funds. Consequently, there is a tremendous need for population estimates and projections by age, sex, race, and ethnicity.

This bulletin provides a summary of our most recent estimates and projections by age, sex, race, and Hispanic origin for Florida and each of its counties from 2009–2030. It also provides a brief description of the methodology used to make those estimates and projections. A more detailed description of the methodology is available on request.

For the state and many counties, the projections published this year are lower than those published last year. This decline was caused by the tremendous slowdown in population growth occurring recently. Whereas Florida's population grew by 385,000 per year between 2000 and 2007, it grew by only 127,000 between 2007 and 2008, and declined by 57,000 between 2008 and 2009. Given the severity of the current economic recession, we believe growth will be slow over the next year. We project an increase of only 23,000 between 2009 and 2010. Although we expect growth rates to increase early in the next decade, for many counties population increases will be smaller in the future than they have been in the past.

Definitions of Race and Ethnicity

The decennial census in the United States is based on self-enumeration. Residents of each household are asked to provide the responses they believe best describe their demographic characteristics, based on guidelines established by the U.S. Census Bureau and the U.S. Office of Management and Budget (OMB). These guidelines allow respondents to identify themselves as Hispanic or non-Hispanic and as belonging to one or more of several racial groups.

It should be noted that "Hispanic" is an ethnic classification rather than a racial category; that is, people can be identified both by Hispanic origin and by race. The OMB defines Hispanic or Latino as "a person of Cuban, Mexican, Puerto Rican, South or Central American, or other Spanish culture or origin regardless of race." For data collection and presentation purposes, federal agencies are required to use a minimum of two ethnicities: "Hispanic or Latino," and "Not Hispanic or Latino." We follow the same guidelines in this report and use the term "Hispanic" to refer to persons of Hispanic, Latino, or Spanish origin.

The three largest racial/ethnic groups in Florida are non-Hispanic whites, non-Hispanic blacks, and Hispanics. These three groups accounted for 96 percent of Florida's population in 2000. This bulletin shows population estimates and projections for these three groups. Estimates and projections for the white, nonwhite, and black populations – not differentiated by Hispanic origin – are available on request.

Data

Data from the 1990 and 2000 censuses formed the basis for these estimates and projections. Although census data are generally quite reliable, there were several problems with the data on race and ethnicity. The first was that the procedures used for collecting racial data in 2000 were different than those used in previous years. In 1990 and all previous censuses, people were required to identify themselves as belonging to a single race. In 2000, they were permitted to identify themselves as belonging to *one or more* races. This difference meant that census data for 2000 were not perfectly consistent with census data for 1990 and earlier years. In Florida, 97.6 percent of the population identified themselves as belonging to a single race in 2000 and 2.4 percent identified themselves as belonging to two or more races.

The second problem was caused by confusion regarding the difference between race and ethnicity. Although the U.S. Census Bureau defines "Hispanic origin" as an ethnic classification rather than a racial category, many respondents interpreted it as a racial category and listed their race as Hispanic, Latino, Mexican, Spaniard, or a similar response. In Florida, 4.4 percent of the total population in 2000 classified themselves as belonging to some race other than those listed on the census forms; more than 90 percent of those respondents were of Hispanic origin.

To solve these problems, the National Center for Health Statistics (NCHS) collaborated with the U.S. Census Bureau to create a set of modified 2000 census counts for every state and county in the United States. Using a variety of data sources and techniques, the NCHS assigned people who classified themselves as belonging to more than one race (or who listed "other" as a racial category) to a single primary race. These modifications produced data that were consistent over time, prevented double-counting of people belonging to more than one race, and provided a racial classification for Hispanics who did not identify their race. The U.S. Census Bureau made similar modifications to the 1980 and 1990 census counts (the so-called MARS data). The estimates and projections described in this report were based on MARS data for 1990 and NCHS data for 2000.

Large institutions (e.g., universities, prisons) account for a significant proportion of the total population in many counties in Florida. In such counties, it is important to account for the impact of these institutions when making population estimates and projections. Consequently, we used institutional records and data from the decennial census to estimate the non-institutional population by age, sex, race, and Hispanic origin for 1990, 2000, and 2009 in the following counties: Alachua, Baker, Bradford, Calhoun, Columbia, DeSoto, Dixie, Franklin, Gadsden, Gilchrist, Glades, Gulf, Hamilton, Hardee, Hendry, Holmes, Jackson, Jefferson, Lafayette, Leon, Liberty, Madison, Okeechobee, Santa Rosa, Sumter, Suwannee, Taylor, Union, Wakulla, Walton, and Washington counties.

In these counties, we made separate estimates and projections for the institutional and non-institutional populations. We also made adjustments to the group quarters data in Dixie and Hendry counties in 1990 and in Franklin and Gulf counties in 2000. The final estimates and projections for each county were constructed by adding together the institutional and non-institutional populations. The remainder of this report focuses primarily on the methodology used for making estimates and projections of the non-institutional population.

Projections of Total Population by Race and Ethnicity

We made projections of the total number of non-Hispanic whites, non-Hispanic nonwhites, and Hispanics for 2010 using a variety of data sources and techniques. Some relied on extrapolations of 1990–2000 population trends, whereas others incorporated data on births, deaths, and school enrollment by race and ethnicity in 1990, 2000, 2008, and 2009. Some projections were based on averages of several of the individual techniques. The final projection for each racial/ethnic group in each county was based on our judgment regarding which technique was most likely to provide an accurate projection of the non-institutional population. A complete description of the methodology can be found in an article by Stanley Smith and June Nogle published in the *Social Science Quarterly* in 2004 (volume 85, pp. 731–745).

Starting with the 2010 projection, we then made projections of the total non-institutional population of each county for non-Hispanic whites, non-Hispanic nonwhites, and Hispanics using the following techniques:

LINE20: linear extrapolation of 1990–2010 non-institutional population change for each racial/ethnic group.

LINE10: linear extrapolation of 2000–2010 non-institutional population change for each racial/ethnic group.

SHARE20: each racial/ethnic group's share of county non-institutional population change 1990–2010 is applied to projected county non-institutional population change.

SHARE10: each racial/ethnic group's share of county non-institutional population change 2000–2010 is applied to projected county non-institutional population change.

EXPO20: exponential extrapolation of 1990–2010 non-institutional population change for each racial/ethnic group.

SHIFT20: the change in each racial/ethnic group's share of county non-institutional population 1990–2010 is linearly extrapolated and applied to county projections of total non-institutional population.

CONST%: each racial/ethnic group's share of the non-institutional population in 2010 is assumed to remain constant over time.

AVE7: an average of projections from the seven techniques described above.

AVE5: an average of these projections, excluding the highest and lowest.

AVE3: an average of these projections, excluding the two highest and the two lowest.

CTRL AVE7: AVE7 controlled to medium county projection of total non-institutional population.

CTRL AVE5: AVE5 controlled to medium county projection of total non-institutional population.

CTRL AVE3: AVE3 controlled to medium county projection of total non-institutional population.

The final projection for each racial/ethnic group in each county was based on our judgment regarding which technique was most likely to provide an accurate forecast of the future non-institutional population. In 63 counties, the final projection was based on CTRL AVE3. In DeSoto, Hardee and Osceola counties, it was based on SHARE20; in Monroe County, it was based on SHIFT20.

In counties with institutional adjustments, projections of the institutional population were based on institutional records and our judgment regarding future institutional growth. Projections of the racial/ethnic breakdown of the institutional population were made by applying the racial/ethnic distribution from the 2000 census to the projections of the total institutional population, which were adjusted to reflect changes in the racial/ethnic distribution of the non-institutional population over the projection horizon.

Finally, projections of total population by race/ethnicity were made by adding projections of the institutional population to projections of the non-institutional population. In all counties, projections for the three racial/ethnic groups were controlled to the medium projections published in "Projections of Florida Population by County, 2009–2035," *Florida Population Studies*, Bulletin No. 156, Bureau of Economic and Business Research, March 2010.

Projections by Age, Sex, and Race/Ethnicity

Projections by age and sex for each of the three racial/ethnic groups were made using a cohort-component methodology in which births, deaths, and migration are projected separately for each age-sex cohort. Age was calculated in five-year groups from 0–4 to 85+. Projections were made in five-year intervals, starting with the 2005 estimates published in 2006; each projection served as the base for the following projection.

Mortality. Future deaths were projected by applying age-sex-specific survival rates to each age-sex cohort in each of the three racial/ethnic groups. Survival rates were applied to each age-sex-race-Hispanic origin cohort to project future deaths in the population. These rates were based on life tables for 2004–2006, which were constructed using data provided by the Public Health Statistics Section, Office of Vital Statistics, Florida Department of Health. Survival rates were adjusted upward in 2010, 2015, 2020, and 2025 to account for projected increases in life expectancy. The adjustments were based on projected

life expectancy for the U.S. population as a whole (U.S. Census Bureau, Population Division Working Paper No. 38, Series NP-05, 2000); they imply that survival rates in Florida will change at the same rate as survival rates in the United States for each age-sex cohort. State-level survival rates were used in each county because county-level rates were not available.

The application of five-year survival rates provides a projection of the number of persons from the initial population expected to be alive after five years.

Migration. Migration is the major determinant of population growth in most counties in Florida. The migration rates used in these projections were based on county migration patterns between 1995 and 2000, as reported in the 2000 census. The migration data included both domestic and international migrants. However, since the decennial census does not include data on out-migration to foreign countries, international in-migration for each county was reduced by 22.5 percent to account for the expected effect of international out-migration. International migration has increased in recent decades and has a substantial impact on population growth in many of Florida's counties.

In-migration rates by age and sex for each racial/ethnic group were calculated by dividing migration into the county by the 1995 population of the United States (excluding that county) in the corresponding cohort. The 1995 population by age and sex for each racial/ethnic group came from the intercensal population estimates released by NCHS. Out-migration rates by age and sex for each racial/ethnic group were calculated by dividing migration out of the county by the 1995 county population in the relevant cohort. These rates indicate the relative probabilities of moving into or out of a county during a five-year interval.

We adjusted these migration rates in a number of counties to account for errors and unusual patterns in the underlying data. These errors and unusual patterns were caused by small population sizes and by the fact that the migration data were derived from an approximately one-in-six sample of the population rather than a complete census count. Adjustments were much more frequent in small counties than large counties. In a further attempt to deal with the problems created by small sample

sizes, we averaged together the migration rates for males and females in most counties; a previous analysis of in- and out-migration rates showed them to be very similar within specific age categories. We believe these adjustments improve the reliability of the projections.

Projections of in-migration for each age-sex cohort in each racial/ethnic group in each county were made by applying in-migration rates to the corresponding group in the U.S. population (excluding that county) and projections of out-migration were made by applying out-migration rates to the corresponding group in the county population. Projected in-migration for each five-year interval was added to the survived county population at the end of that interval and projected out-migration was subtracted, giving a projection of the population age 5 and older.

Fertility. Births were projected by applying age-specific birth rates (adjusted for child mortality) to the projected female population of each racial/ethnic group. The starting point was a set of age-specific birth rates constructed separately for each county using population data from the 2000 census and 1999–2001 birth data by age of mother, as compiled by the Public Health Statistics Section of the Florida Department of Health. Again, some adjustments were made to account for apparent data errors, inconsistencies caused by small population sizes, and the impact of institutional populations on birth rates. In some counties, rates were adjusted upward or downward to account for fertility changes occurring between 1999–2001 and 2004–2006. At the state level, current rates imply approximately 1.8 births per woman for non-Hispanic whites, 2.3 for non-Hispanic nonwhites, and 2.4 for Hispanics.

We assumed that high birth rates would decline gradually over time while low birth rates remained constant at current levels. More detailed information regarding county birth rates is available on request.

The projected number of births during each five-year interval provides a preliminary projection of the population age 0–4. Small adjustment factors were applied to account for migration and the impact of infant and child mortality. The population age 0–4 was divided between males and females using proportions of 0.51 and 0.49, respectively.

Total Population. For each of the three racial/ethnic groups, we controlled the non-institutional age/sex projections to the independent projections of the total non-institutional population described previously. Then, we added the independent projections of the institutional population, providing projections by age and sex for non-Hispanic whites, non-Hispanic nonwhites, and Hispanics. Each five-year projection served as the base for the following five-year projection. Projections at the state level were calculated by adding up the county projections.

Projections for other Racial/Ethnic Groups

We developed projections for several additional racial/ethnic groups. Using the 2000 NCHS data, we calculated the white/nonwhite proportion of the Hispanic population for each county and applied those proportions to the Hispanic estimates and projections to provide a white/nonwhite breakdown of the Hispanic population (in Florida, approximately 95 percent of the Hispanic population identified themselves as white in the 2000 census). Adding the Hispanic white population to the non-Hispanic white population provided estimates and projections of the total white population by age and sex for each county.

Using MARS data for 1980 and 1990 and NCHS data for 2000, we calculated blacks as a proportion of nonwhites for both the Hispanic and non-Hispanic populations. We made those calculations separately for each county and – based on historical trends and the 2000 values – projected those proportions into the future. By applying these proportions to estimates and projections of the nonwhite population (for both Hispanics and non-Hispanics), we developed estimates and projections of the non-Hispanic black population and the total black population by age and sex for each county. This bulletin provides estimates

and projections for non-Hispanic whites, non-Hispanic blacks, and Hispanics, the three most numerous racial/ethnic groups in Florida. Estimates and projections for these three groups do not sum exactly to estimates and projections of the total population in most counties because they do not include estimates and projections of the non-Hispanic population that is neither white nor black.

Estimates for 2009

The methodology described above was used to make projections by age, sex, race, and Hispanic origin in five-year intervals from 2005 to 2030 for each county in Florida. Estimates for 2009 were made by interpolating between the 2005 estimates and the 2010 projections for each age/sex/racial/ethnic group and controlling those interpolations to the 2009 estimates of total population published in *Florida Estimates of Population: April 1, 2009,* published by the Bureau of Economic and Business Research in January, 2010.

Note: More Detailed Data Available

This bulletin provides data for abbreviated age groups for non-Hispanic whites, non-Hispanic blacks, and Hispanics. Data in five-year age groups up to age 85+ (including a breakdown for ages 15–17 and 18–19) are also available, not only for the three racial/ethnic groups shown here but also for the white, nonwhite, and black populations without reference to Hispanic origin. These data may be ordered from the Bureau of Economic and Business Research by calling 352-392-0171, extension 212.
