## Athletic Field Use Capacity

[Sports Turf Managers Association – Click here for full article](#)

Grady L. Miller, Ph.D., Environmental Horticulture Department, Institute of Food and Agricultural Sciences, University of Florida, Gainesville, Florida

<b>Field Conditions</b>	<b>Hours Per Year</b>
<b>Sustain good conditions</b>	<b>200 hours or less</b>
<b>Fair to good conditions some thinning turf and localized wear areas</b>	<b>400 to 600 hours</b>
<b>Significant turf loss field surface damage increased potential for athletic injury</b>	<b>Over 800 hours</b>

### Use

The question still has not been answered regarding how much use a field can handle. This question is best answered using actual data on field use from previous years. This requires some careful documentation of games, practices, and other events. As the demand for fields increases, it seems that more entities are starting to track field use. Probably the easiest data to track is the number of hours the fields are used during the year.

Using data from a number of fields located around the state of Florida, and talking with turf managers and municipality supervisors, I have made a few general estimates related to field use (Table 1). These educated predictions are for football and soccer fields that are used nearly year round. Baseball and softball should be evaluated differently since so much of the game is played on a clay infield. The estimates assume the field is surfaced with a quality bermudagrass and begins the year with good coverage. The values relate to well-constructed fields that receive at least moderate maintenance and are used under reasonable conditions. The reality is that it only takes one extremely wet game to destroy a field. The values are based on all the events that occur on the field, including practices. Practices can also cause appreciable damage due to their repetitive nature in particular areas of a field, so they must also be put into the equation.

The number of events a field can handle will ultimately depend upon field construction, weather conditions during the season (especially just before and during games), maintenance practices, recuperative periods, and the time of the year.

To maximize field conditions,

1. Make every effort to begin the sporting season with 100 percent turf coverage.
2. Adjust maintenance practices to address the condition of the fields.
3. Schedule recuperative times during the season, realizing that non-overseeded bermudagrass fields will not recuperate very quickly in the late fall or winter months.
4. Overseed if you expect excessive wear during cooler months that are not conducive for bermudagrass growth. The need and timing for overseeding also depends on your location. Below Orlando, overseeding is typically not necessary.

Obviously, the more traffic you put on the field, the faster the turf declines. Also, particular sports cause more severe damage in localized areas on the field. Football tends to cause extreme wear between the hash marks. Soccer wears the quickest in the middle of the field, in front of the goal mouths, along the sidelines (due to linesmen) and the corner kick areas. Any repetitive action on the same area of the field accelerates wear. That is why practices and warm-up drills are often more damaging than games. But it is not just the athletes on the field that can cause wear problems. A marching band is extremely hard on a field because they tend to march along the same lines all the time, both during a game and in practice. Cheerleaders and pep squads during games may also result in turf damage due to heavy use in a confined area.

You can get some reduction in traffic damage by doing the following:

1. Restrict use when soil is very wet
2. Restrict use when soil is very dry and turf is wilted
3. Always have coaches rotate heavy play areas during practices
4. If possible move soccer field sidelines of field during the year
5. On game fields, restrict all practices to a minimum
6. Restrict field use when grass is dormant
7. Do not allow unofficial play
8. Use tarps (covers) on bench areas to reduce severe wear by coaches and team members, and on sideline areas used by the cheerleaders

## **Conclusion**

In most cases you will need to educate field users. Most do not understand the damage that they can cause. While it may be obvious to you that the field is too wet for play, it is not obvious to most field users. Close fields when it is necessary. If you are not allowed to close the fields, at least make the decision makers aware of the potential short- and long-term damage that may result from field use given the situation. Unfortunately, some fields are scheduled the same as basketball courts or hard-surface tennis courts, without consideration of wearability of the turf surface. The field manager is in the best position to decide how much is too much.
